

“This reprint might contain references to “Merck” or “Merck KGaA”, which refer to (1) Merck KGaA, Darmstadt, Germany; (2) an affiliate of Merck KGaA, Darmstadt, Germany; or (3) one of the businesses of Merck KGaA, Darmstadt, Germany, which operate as EMD Serono in the healthcare, MilliporeSigma in the life science and EMD Electronics in the electronics business in the U.S. and Canada.

There are two different, unaffiliated companies that use the name “Merck”. Merck KGaA, Darmstadt, Germany, which is providing this content, uses the firm name “Merck KGaA, Darmstadt, Germany” and the business names EMD Serono in the healthcare, MilliporeSigma in the life science and EMD Electronics in the electronics business in the U.S. and Canada. The other company, Merck & Co., Inc. holds the rights in the trademark “Merck” in the U.S. and Canada. Merck & Co., Inc. is not affiliated with or related to Merck KGaA, Darmstadt, Germany, which owns the “Merck” trademark in all other countries of the world.”

Risk of Specific Infections in Patients with Multiple Sclerosis Versus Matched Controls: An Analysis of Administrative Claims Data

¹Weill Institute for Neurosciences, University of California, San Francisco, CA, USA; ²CK Consulting Associates, LLC, Saint Helena Island, SC, USA; ³EMD Serono, Inc., Rockland, MA, USA, an affiliate of Merck KGaA, Darmstadt, Germany

SUMMARY

- Few population-level risk estimates for specific categories of infections in patients with multiple sclerosis (MS) exist in the United States (US)
- The objective of this study was to assess the risks of specific infection categories in patients with MS vs. matched controls
- This study examined relative risk for outpatient claims and inpatient hospitalizations for specific infections using urinary/kidney, pneumonia/influenza, other respiratory/throat, viral, skin, fungal, and opportunistic infection categories among patients with MS versus controls

- The IQVIA™ RWD Adjudicated Claims–US database (1/1/2010–6/30/2019) was used
- Outpatient claims and inpatient hospitalizations for urinary/kidney infections were higher among patients with MS than matched controls
- Findings will be helpful to clinicians and healthcare payers in understanding the burden of specific infections among patients with MS

DISCLOSURES & ACKNOWLEDGMENTS

This study was sponsored by EMD Serono, Inc., Rockland, MA, USA, an affiliate of Merck KGaA, Darmstadt, Germany. Writing and editorial support for the preparation of this poster was provided by Natalie C. Edwards, MSc of Health Services Consulting Corporation and Erich Junge and Nick White of Ashfield MedComms, an AshfieldHealth company (New York, NY, USA); funding was provided by the study sponsor. The authors had full control of the poster and provided their final approval of all content.

RB: has received research support from the National Multiple Sclerosis Society, the Hilton Foundation, the California Initiative to Advance Precision Medicine, the Sherak Foundation, Akili Interactive, Biogen, and Roche Genentech. RB has also received personal compensation for consulting from Alexion, Biogen, EMD Serono, Inc., Rockland, MA, USA, an affiliate of Merck KGaA, Darmstadt, Germany, Novartis, Sanofi Genzyme, Roche Genentech and Pear Therapeutics.

TS: subcontractor for CK Consulting Associates, LLC. CK Consulting Associates, LLC, received funding from EMD Serono, Inc., Rockland, MA, USA, an affiliate of Merck KGaA, Darmstadt, Germany, to conduct the study.

CK: employee of CK Consulting Associates, LLC. CK Consulting Associates, LLC, received funding from EMD Serono, Inc., Rockland, MA, USA, an affiliate of Merck KGaA, Darmstadt, Germany, to conduct the study.

ALP, DEH, and CL: employees of EMD Serono, Inc., Rockland, MA, USA, an affiliate of Merck KGaA, Darmstadt, Germany.

BACKGROUND INFORMATION

- **Published studies** have **demonstrated** an **increased risk of infection**,¹⁻⁵ infection-related **hospitalization**,¹⁻⁵ and **mortality** due to infection^{3,6} in patients with MS compared to patients without MS
- It is **important to understand the risk of specific infections in patients with MS**; however, population-based studies in the US are rare

OBJECTIVE

- **To assess the relative risk (RR) of specific infections in patients with MS vs. matched controls** using IQVIA™ Real World Data Adjudicated Claims–US data (1/1/2010–6/30/2019)

Abbreviations: **CI**, confidence interval; **HCV**, hepatitis C virus; **HIV**, human immunodeficiency virus; **ICD-9/10-CM**, International Classification of Diseases, 9th/10th Edition – Clinical Modification; **MS**, multiple sclerosis; **RR**, relative risk; **RWD**, real-world data; **SD**, standard deviation.

References: **1.** Persson R, et al. *Mult Scler Relat Disord* 2020;41:101982. **2.** Wijnands JM, et al. *Mult Scler* 2017;23(11):1506-16. **3.** Nelson RE, et al. *Int J MS Care* 2015;17(5):221-30. **4.** Montgomery S, et al. *Eur J Neurol* 2013;20(8):1153-60. **5.** Marrie RA, et al. *Neurology* 2014;83(10):929-37. **6.** Goodin DS, et al. *PLoS One* 2014;9(8):e105207.

METHODS

- The MS cohort had **≥2 MS diagnoses** (ICD-9-CM/ICD-10-CM: 340.xx/G35) ≥30 days apart
- The control cohort had **2 diagnoses for any other condition** ≥30 days apart
- The index date was a randomly selected office visit
- **Inclusion criteria** were:
 - Age 18–64 years
 - 12-month eligibility pre-/post-index
 - No antibiotic/antiviral claim 60 days prior to index claim
 - No claim for pregnancy/inpatient residential care/end-stage renal disease facility/HIV/HCV
- Cohorts were **matched 1:1 on age, sex, payer type, census region, and index year**
- **RR** were **estimated for presence of outpatient claims and inpatient hospitalization** for urinary/kidney, pneumonia/influenza, other respiratory/throat, viral, skin, fungal, and opportunistic **infections** in the **12-month post-index** period
- RR were evaluated in a modified Poisson regression model with robust error variance
- ICD-9-CM/ICD-10-CM codes for urinary/kidney, pneumonia/influenza, other respiratory/throat, viral, skin, fungal, and opportunistic **infections** were identified from Wijnands et al¹

RESULTS

Patient baseline characteristics

- There were **87,755 patients with MS** and **87,755 control patients** (mean [SD] age 47.3 [10.5] years, 75.7% female)
- After exact matching, the **baseline characteristics** of the two groups were **exactly-balanced**
- There was similar variability in geographic distribution between the groups
- Nearly **two-thirds** of patients from both groups (**65.7%**) had **commercial insurance** and **one-third (34.3%)** had **self-insured employer insurance**

Patient baseline characteristics post-matching

Characteristic	MS Cohort (n=87,755)	Non-MS Cohort (n=87,755)
Age, years		
Mean (SD)	47.3 (10.5)	47.3 (10.5)
Median	49.0	49.0
Age Group, n (%)		
18 to <40	20,653 (23.5%)	20,653 (23.5%)
40 to <50	26,160 (29.8%)	26,160 (29.8%)
50 to <60	29,705 (33.9%)	29,705 (33.9%)
≥60	11,237 (12.8%)	11,237 (12.8%)
Sex, n (%)		
Female	66,453 (75.7%)	66,453 (75.7%)
Male	21,302 (24.3%)	21,302 (24.3%)
Region		
East	22,382 (25.5%)	22,382 (25.5%)
Midwest	27,438 (31.3%)	27,438 (31.3%)
South	28,720 (32.7%)	28,720 (32.7%)
West	9,215 (10.5%)	9,215 (10.5%)
Payer Type		
Commercial	57,627 (65.7%)	57,627 (65.7%)
Self-Insured Employer	30,128 (34.3%)	30,128 (34.3%)

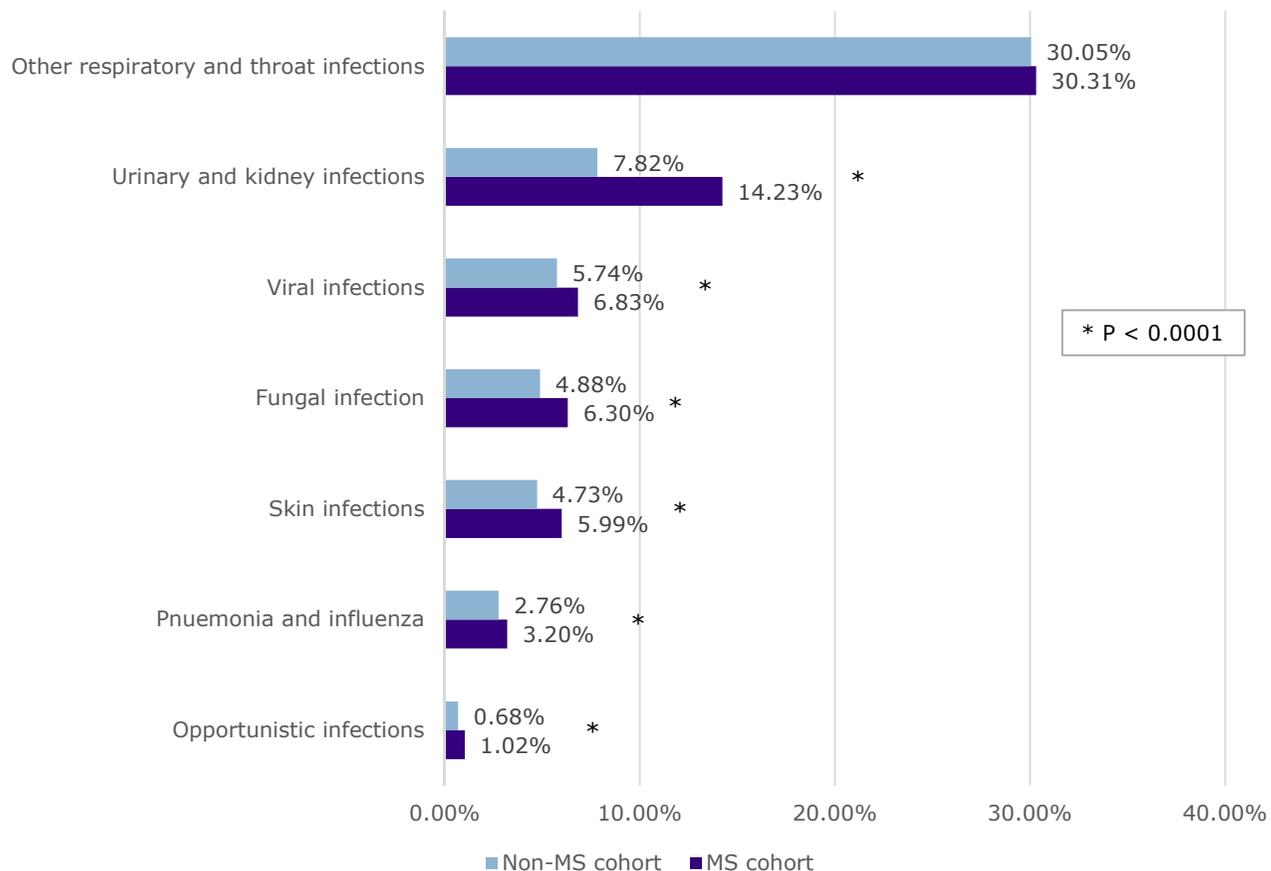

RESULTS

Outpatient infection diagnosis

• The RR (95% CI) of patients with MS vs. controls of outpatient claims for infections were:

- **Other respiratory/throat:** 1.01 (0.99–1.02), p=0.24
- **Urinary/kidney:** 1.82 (1.77–1.87), p<0.0001
- **Viral:** 1.19 (1.15–1.23), p<0.0001
- **Fungal:** 1.29 (1.24–1.34), p<0.0001
- **Skin:** 1.26 (1.22–1.32), p<0.0001
- **Pneumonia/influenza:** 1.16 (1.10–1.23), p<0.0001
- **Opportunistic infections**:** 1.50 (1.35–1.66), p<0.0001

Outpatient infection claims

** Opportunistic infections category includes pneumocystis pneumonia, cryptosporidiosis, mycobacteria, bartonellosis, other mycoses, cryptococcosis, cytomegaloviral disease, human papillomavirus, other viral hepatitis, progressive multifocal leukoencephalopathy, Epstein-Barr virus, histoplasmosis, toxoplasmosis, and legionella.

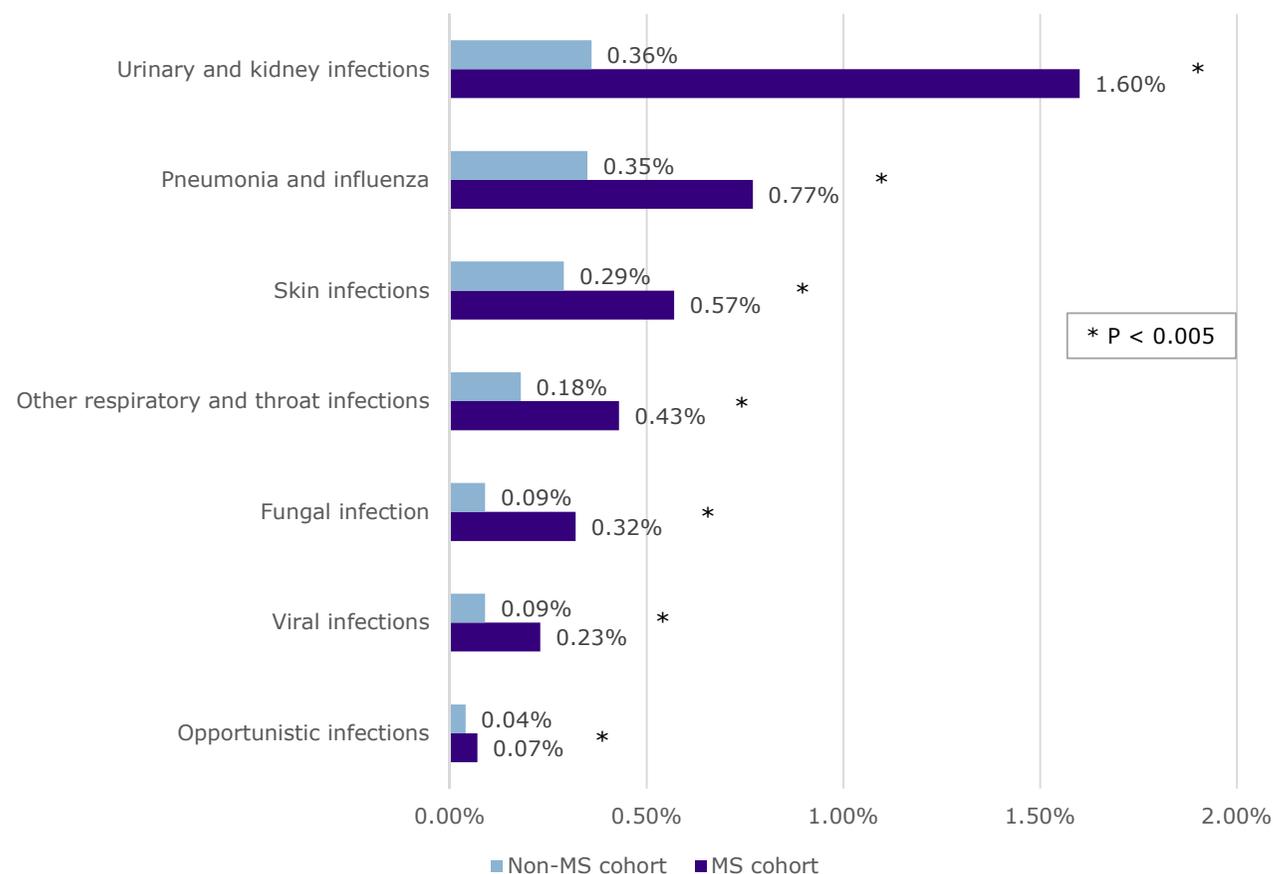

RESULTS

Inpatient infection diagnosis

- The RR (95% CI) of patients with MS vs. controls of inpatient hospitalizations for infection were:
 - **Urinary/kidney:** 4.49 (3.98–5.08), $p < 0.0001$
 - **Pneumonia/influenza:** 2.22 (1.94–2.54), $p < 0.0001$
 - **Skin:** 1.95 (1.68–2.27), $p < 0.0001$
 - **Other respiratory/throat:** 2.37 (1.97–2.85), $p < 0.0001$
 - **Fungal:** 3.69 (2.86–4.77), $p < 0.0001$
 - **Viral:** 2.58; (1.99–3.36), $p < 0.0001$
 - **Opportunistic infections**:** 1.94 (1.26–2.97), $p = 0.0024$

Inpatient infection claims

** Opportunistic infections category includes pneumocystis pneumonia, cryptosporidiosis, mycobacteria, bartonellosis, other mycoses, cryptococcosis, cytomegaloviral disease, human papillomavirus, other viral hepatitis, progressive multifocal leukoencephalopathy, Epstein-Barr virus, histoplasmosis, toxoplasmosis, and legionella.

CONCLUSIONS

- **Outpatient claims and inpatient hospitalizations for urinary/kidney infections were higher among patients with MS** than controls
- Findings provide **insights** to clinicians and healthcare payers **into the burden of outpatient and inpatient infections among patients with MS**

LIMITATIONS

- **Patients in this study had commercial health insurance** and findings may not apply to patients with no commercial health insurance
- We were unable to further categorize infection risk in MS patients based on disease severity
